

## **Streamlining Ordering Provider Notification Through Automation of the Vocera Paging System**

Author: Connor Solan

Notifying ordering providers of urgent results is a time consuming and frequently occurring activity

during busy call shifts, which detracts from the throughput of high imaging volumes and interpretation of complex cases. Using a freely available macro scripting language (AutoHotKey) we have reduced the "clicks" necessary to send pages to ordering providers and minimised redundant information entry in order to devote more physician attention to detection of imaging abnormalities and improve patient care.
